ABSTRACT

An estimated 64,798,000 persons, or 25% of the population of the United States, lived in rural areas in 1988. Rural areas include open countryside and places with fewer than 2,500 inhabitants not in the suburbs of large cities. This report presents demographic data on the rural population, pointing out that comparison with 1987 data suggests a leveling off of farm population decline. Almost half of the rural population in 1988 was located in metropolitan statistical areas (MSAs); and about one quarter of the farm population lived in MSAs. The farm population is older than other components of the population. About 2.6 percent of the employed labor force worked in farm occupations. Money income for the year 1987 was lower for households and families living on farms than for those in nonfarm areas. The report examines size, distribution, social, and economic characteristics of the rural population. Tables show U.S. population by urban/rural, farm, and metropolitan/nonmetropolitan residence. They also show occupation, poverty status, regional distribution, labor force participation, and income distribution by farm/nonfarm residence. Detailed tables show race, age, sex, marital status, fertility characteristics, family characteristics, employment status, and income of households and families by farm/nonfarm residence. Appendices describe the source and accuracy of the estimates, and display the survey questionnaires. (DHP)

Rural and Rural Farm Population: 1988

INTRODUCTION

An estimated 64,798,000 (±875,000) persons, or one-fourth of the population of the United States, lived in rural areas in 1988 (table A).[1] The Nation's population was predominantly rural until the early part of this century. For example, in 1790, when the first census was taken, 19 out of every 20 persons had a rural residence whereas the 1920 census was the first to show a predominantly urban population (51.2 percent).

About 4,951,000 (±204,000) rural residents lived on farms in 1988. This figure represents 1 out of every 49 persons, or 2.0 (±0.1) percent of the Nation's population (table B). Farm residents represented 30.2 percent of the total population in 1920, when they were first identified as a separate group in census statistics;[2] this proportion fell to 15.3 percent by 1950, to 4.8 (±0.1) percent by 1970, and to 2.7 (±0.1) percent by 1980.

The estimates of the rural and rural farm population are annual averages of monthly data from the Current Population Survey (CPS) for the calendar year 1988. They were prepared by the U.S. Bureau of the Census and the Economic Research Service of the Department of Agriculture.

Rural areas include the open countryside and also places with fewer than 2,500 inhabitants, that are not in the suburbs of large cities. Large cities and suburbs plus places of 2,500 or more inhabitants are considered urban areas. The farm population in the CPS consists of persons living on farms in rural areas of the country; it does not include residents of the relatively small number of farms located in urban areas. A farm is defined as a place which sold agricultural products amounting to $1,000 or more during the preceding year. (See appendix A for more detailed definitions.)

This report presents information on race and Hispanic origin, age and sex, and labor force activities of the rural and rural farm population for 1988. The report also includes, for farm residents, fertility characteristics from the June 1988 CPS supplement and data from the March 1988 CPS supplement on marital status, household and family composition, and income and poverty.

HIGHLIGHTS

- Since 1986, when intercensal rural data were first published, the rural population has grown more rapidly than the urban population. The rural growth rate between 1986 and 1988 was 2.64 (±0.91) percent, compared with an urban rate of 1.67 (±0.22) percent.
- The 1988 farm population estimate of 4,951,000 (±204,000) is not significantly different from the 1987 estimate, which may reflect a leveling off in the long-term decline in the number of farm residents.
- A considerable portion of the rural population, 45.9 (±0.8) percent in 1988, was located in metropolitan statistical areas (MSA's). About one-fourth (26.2 ±1.8 percent) of farm residents lived in MSA's.
- The farm population is older than the other residential components of the population. The median age of farm residents was 38.0 (±1.6) years in 1988, compared to medians of 33.1 (±0.5) years for the total rural population and 32.1 (±0.2) years for the urban population.
- About 2.6 (±0.1) percent of the employed labor force worked in farm occupations in March 1988, down from 37.5 percent in 1900 and 71.8 percent in 1820, the first year an industry/occupation question was asked in the census.
- Money income for the year 1987 was lower for households and families living on farms than for those in nonfarm areas. Median income for farm households was $24,130 (±$1,808), compared with $26,030 (±$205) for nonfarm households; median income for farm families was $26,020 (±$1,765), compared with $30,970 (±$229) for nonfarm families.

SIZE AND DISTRIBUTION

Change in number. The rural population grew by 2.6 percent between 1986 (the first year for which intercensal rural data were published) and 1988, compared with

[1] Figures following the ± notation in the Introduction and Highlights sections represent ± 1.6 standard errors of the estimated statistic or the 90-percent confidence interval for the estimate. See appendix B for further explanation of confidence intervals.

[2] The 1920 census is regarded as the beginning of the series of census data on farm population. Estimates back to 1880 were prepared by Leon E. Truesdell, a Census Bureau demographer, and were published in U.S. Bureau of the Census, Technical Paper No. 3, *Farm Population: 1880 to 1950*, Washington, DC, 1960. The estimates were based on data on number of farms, number of farm families, size of farm families, and interrelationships of these factors over time. The estimated number of farm residents and their proportion of the total population for 1880 were 21,973,000 and 43.8 percent; for 1890, 24,771,000 and 39.4 percent; for 1900, 29,875,000 and 39.3 percent; for 1910, 32,077,000 and 34.9 percent.

an increase of 1.7 percent in the urban population (table A). The rural estimates for 1986 to 1988 reflect civilian noninstitutional population and are not directly comparable with the 1980 and earlier decennial census counts shown in table A, which refer to the total resident population.

Urban growth has outpaced rural growth in every decade of our Nation's history, except for 1810-20 when the urban percentage fell by one-tenth of a percentage point. Growth in the urban percentage slowed to almost a halt during the 1970's. It increased by one-tenth of a percentage point because a change was made in the procedures for defining urban. If the procedures had not been changed, the urban proportion would have declined by two-tenths of a percentage point during the 1970-80 decade.[3]

Although the estimates in table A show that the rural population grew more rapidly than the urban from 1986 to 1988, this does not mean that the percent rural will increase between 1980 and 1990. The data in table A for 1986 to 1988 are based on urban-rural boundaries defined at the time of the 1980 decennial census. Since 1980, some rural areas have experienced rapid growth. In 1990, when urban areas are redefined, many growing rural areas will be reclassified as urban. Thus, some of the rural growth shown here will show up as growth in the urban population in the 1990 census.

The farm resident population estimate of 4,951,000 shows no statistically significant change since 1987 (table B).[4] The 1988 farm population estimate is only 35,000 lower than in the previous year; a difference of about 276,000 would be needed for the decline to be statistically significant at the 90-percent confidence

[3]DeAre, Diana and Larry Long, "Did the U.S. Undergo Ruralization in the 1970s?", *Intercom*, Population Reference Bureau, Inc., Vol. 10, No.4, April 1982.

[4]Comparisons made in the text that test below the 90-percent confidence level are not considered statistically significant.

1810	7,240	525	6,714	7.3	92.7
1800	5,308	322	4,986	6.1	93.9
1790	3,929	202	3,728	5.1	94.9

[1]Figures for 1986-88 are annual averages from the Current Population Survey and refer to the civilian noninstitutional population. Figures for earlier years are from the decennial censuses of population and refer to the total resident population. The 1986-88 urban and rural estimates are based on the urban/rural geography used in the 1980 census. Estimates of urban and rural population for earlier years are based on the current boundaries at each decennial census.

[2]See appendix A for current and previous urban definitions.

[3]The 1970 census count of the total population was revised to 202,302,031, but the unrevised total is shown here because revised urban and rural components are not available.

Table B. **U.S. Population, by Farm Residence: 1920 to 1988**

1930	122,775	30,529	24.9
1920	105,711	31,974	30.2

[1]Census Bureau estimates for July 1 for 1980 to 1988; official census counts for earlier years. The 1980 estimate is consistent with the 1980 census.

[2]Figures for 1960 and later years are from the Current Population Survey; figures for earlier years are from *Farm Population Estimates, 1910-70*, U.S. Department of Agriculture, Statistical Bulletin No. 523, July 1973. Annual averages for 1984 to 1988; five quarter averages centered on April for 1960 to 1983. Figures for 1981 and later years are consistent with the 1980 census. See appendix A for further explanation.

[3]See appendix A for current and previous farm definitions.

[4]The total population figure shown here differs from that shown in table A because the latter refers only to the civilian noninstitutional population, whereas this refers to the total resident population.

[5]The 1980 estimates are based on the population controls from the 1970 census and thus are not directly comparable to the estimates for 1981 and later years. The total resident population from the 1980 census was 226,545,805.

level.[5] The lack of change may reflect a leveling off in the long-term decline in number of farm residents, but more than one year of data showing stability would be needed to confirm this pattern. Earlier in the decade, between 1983 and 1984, the decline in farm population also appeared to halt but was then followed by a resumption of loss.

Regional distribution. The South has the largest share of the rural population (44 percent), which has been the case since the first census was taken in 1790. In the last 40 years, the distribution of the rural population among regions has changed by only a couple of percentage points. The regional concentration of the farm population, in comparison, shows marked change over the period (figure 1 and table 1). In 1950, about one-third of all farm residents were in the Midwest, while slightly more than half lived in the South. The more rapid decline of the Southern farm population, rather than growth in the Midwest's farm residents, led to a reversal in regional rankings. Half of the total farm population now lives in the Midwest, whereas the South contains 30 percent. The West has 15 percent, up from 8 percent in 1950, and the Northeast has just 5 percent, down from 8 percent in 1950. Reliable farm population data for 1988 for States and local areas are not available from the survey.

Regional changes in the total population contrast with those of the farm population. The South has remained the most populous region since 1950; in fact, the region's rapid growth has resulted in a slight increase in its share of the total population while the Midwest's share has declined. The West's share of the total population also increased over the period, whereas the Northeast's share decreased.

Metropolitan-nonmetropolitan residence. The metropolitan-nonmetropolitan breakdowns of the rural and farm population are shown in table C. Metropolitan refers to the population residing in metropolitan statistical areas (MSA's). An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definition specifies a boundary around each large city so as to include most or all of its suburbs. Entire counties form the MSA's, except in New England, where cities and towns are used. Nonmetropolitan refers to the population living outside MSA's.

Since metropolitan areas use entire counties as building blocks, they can include considerable rural population and land area.[6] In fact, eight metropolitan areas had more rural than urban population in 1980, and 46 percent of the rural population was located in MSA's in 1988.[7] Although the majority of rural farm residents live in nonmetropolitan territory, about one-fourth lived within the boundaries of metropolitan areas in 1988.

SOCIAL CHARACTERISTICS

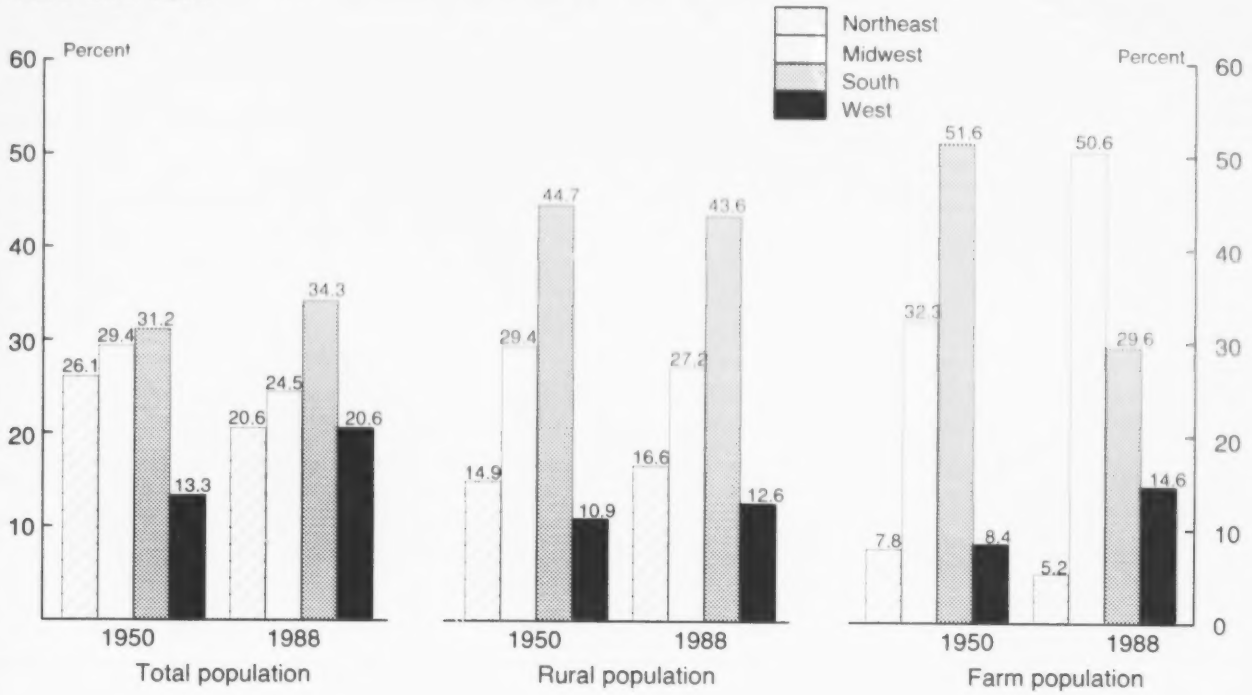
Race and Hispanic origin. The farm population has a higher proportion of Whites and a lower proportion of Blacks than the nonfarm population. (The nonfarm

[5]The 90-percent confidence interval for the change between 1987 and 1988 is ±280,000. Since the confidence interval contains zero, it is uncertain whether there is an increase or decrease. See appendix B.

[6]The 1980 Census of Population showed 40 percent of the rural population located in metropolitan areas. The metropolitan areas used for the 1988 CPS estimates include additional counties defined as metropolitan after the 1980 census.

[7]The eight areas were Danville, VA; Glens Falls, NY; Hickory, NC; Johnstown, PA; Ocala, FL; St. Cloud, MN; Sharon, PA; and York, PA.

Figure 1.
Regional Distribution of the Population, by Residence: 1950 and 1988



population is the sum of the urban population and the rural nonfarm population.) In 1988, 97.1 percent of farm residents were White and 2.2 percent were Black, compared with 84.2 percent White and 12.4 percent Black in the nonfarm population (table 2). Only 2.8 percent of farm residents were of Hispanic origin (who may be of any race), whereas 8.2 percent of the nonfarm population were Hispanic.

The farm population also has a higher proportion of Whites and a lower proportion of Blacks than the rural population not living on farms (table 3). The rural farm and rural nonfarm populations have about the same proportion of Hispanics.

The total rural population, in comparison to the urban population, has proportionately more Whites, fewer Blacks, and fewer Hispanics. In 1988, the rural population was approximately 92 percent White, 6.4 percent Black, and 2.5 percent Hispanic (table 3); the urban population was about 82 percent White, 14.3 percent Black, and 10.2 percent Hispanic.

Table C. **Metropolitan and Nonmetropolitan Residence of the Population: 1988**

(Current Population Survey annual averages. Numbers in thousands)

Residence	Total	Metropolitan	Nonmetropolitan
Total	[1]240,887	187,106	53,781
Urban	176,089	157,392	18,697
Rural	64,798	29,714	35,084
Rural nonfarm	59,847	28,415	31,432
Rural farm	4,951	1,299	3,652
PERCENT DISTRIBUTION			
Total	100.0	77.7	22.3
Urban	100.0	89.4	10.6
Rural	100.0	45.9	54.1
Rural nonfarm	100.0	47.5	52.5
Rural farm	100.0	26.2	73.8

[1]The total population figure shown here differs from that shown in table B because the latter refers to the total resident population, whereas this refers only to the civilian noninstitutional population.

Age and sex. The farm population is older than the other residential components of the population, whereas it was the youngest component in the first half of the century (figure 2). The median age of farm residents was 38.0 years in 1988, which is significantly higher than the median of 32.2 years for the nonfarm population (table 4). The age difference is not just an urban-rural difference; farm residents are older than the rural population in general. In 1988, the median age of the urban population was 32.1 years, and the median age of the rural total was a little higher at 33.1 years, but both were

significantly lower than the farm population median (table 5). In the 1920 census, the median age for the farm population was 20.7 years, lower than the medians for the rural total and the urban population.

The ratio of males to females is higher in the farm population than in the nonfarm population, as it has been since at least 1920. There were 109 males per 100 females living on farms in 1988, compared with just 94 males per 100 females in the nonfarm population (table 4). In 1920, the nonfarm sex ratio (102) was considerably higher than it is now, while the farm ratio was the same (109).

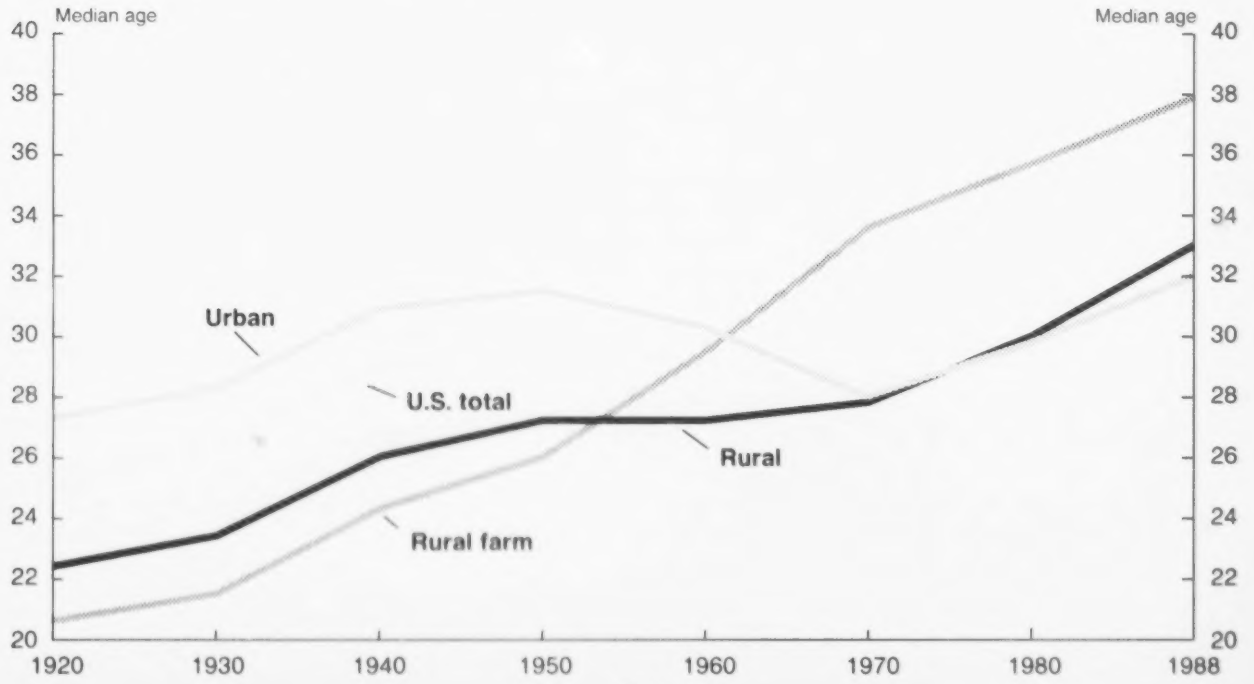
Marital status. A higher proportion of farm residents than nonfarm residents are married. About 69 percent of farm residents 15 years and over were married and living with a spouse in 1988, compared with 56 percent of nonfarm residents (table 6). Relatively fewer farm than nonfarm residents were married and living apart, widowed, divorced, or single.

The farm-nonfarm differences in proportions married were greater among women than men: 73 percent of farm women were married and living with their husbands versus 53 percent of nonfarm women, whereas 66 percent of farm men were married and living with their wives versus 58 percent of nonfarm men. Fewer farm than nonfarm men were married with spouse absent, but there were no significant differences between farm and nonfarm men for the other marital status categories. Farm women had lower proportions single, widowed, married with spouse absent, and divorced than nonfarm women. This probably reflects a tendency toward increased outmigration of young farm women as they reach maturity, and outmigration or cessation of farming activities for older women upon loss of their husbands.

Fertility. The fertility of farm women of childbearing age is a little higher than that of nonfarm women. According to data for June 1988, the number of children ever born to farm women 18 to 44 years averaged 1,533 per 1,000 women (table 7). The number of children ever born to nonfarm women was 1,337 per 1,000 women.

The fertility rates for farm and nonfarm women under 35 years of age were about the same (1,011 versus 983). For the age group of women that had about completed fertility, that is, women 35 to 44 years of age, the rate of 2,297 per 1,000 farm women appears higher than the nonfarm rate of 2,034, but the difference is not statistically different. This is in part due to the small number of farm women in the age group and the resultant high standard errors. In the 1980 census, which had a larger sample and lower standard errors,

Figure 2.
Median Age of the Population, by Urban, Rural, and Rural Farm Residence: 1920 to 1988



the fertility rate for farm women 35 to 44 years was 3,021 per 1,000 women, significantly higher than the nonfarm rate of 2,630.

Households and families. The number of farm households has declined over the last half century, just as the farm population has. In 1940, about 1 out of every 5 households was a farm household; in 1988, the proportion was only about 1 out of 50 (table 8). There were an estimated 1,684,000 farm households in March 1988.

The number of farm families in March 1988 was 1,428,000 (table 9). A family consists of two or more related persons living together. A higher proportion of farm families than nonfarm families had both a husband and wife present (94 percent versus 79 percent). The proportion of farm families maintained by a woman without a husband present was only 3.1 percent—about one-fifth of the nonfarm proportion of 16.6. There was also a lower proportion of farm than nonfarm families maintained by a man without a wife present (2.7 percent versus 4.2 percent).

Farm families were considerably larger than nonfarm families in the past, but the average size of farm and nonfarm families was almost identical in 1988—3.19 persons versus 3.17 persons (table 9). Farm families in 1950, in comparison, averaged 4.13 members while nonfarm families had 3.52 members. The similarity today in average size partially reflects the lower likelihood of farm families having children living at home. About 60 percent of farm families did not have children under 18 years living at home in March 1988, compared with 51 percent of nonfarm families. Although farm women have higher childbearing rates than nonfarm women, a higher proportion of farm women are past the childbearing ages (table 4).

ECONOMIC CHARACTERISTICS

Labor force participation and unemployment. Farm residents are more likely than nonfarm residents to be in the labor force and less likely to be unemployed. About 70 percent of farm residents 15 years and over were in the labor force in 1988, compared with 65 percent of the nonfarm population (table 10). Only 2.0 percent of the farm resident labor force was unemployed; the unemployment rate for the nonfarm labor force was 5.7 percent. There was a difference in participation rates in the two major farming regions, the Midwest (72.4 percent) and South (64.9 percent), but unemployment rates were not significantly different (table 11).

The higher proportion of farm residents in the labor force is the result of higher participation of farm men, whereas the lower unemployment rate of farm residents is the result of lower unemployment for both sexes. In every age group except 20 to 24 years, the proportion of farm men in the labor force was significantly higher than that of nonfarm men (figure 3 and table 12). Farm women, however, had about the same proportion in the labor force as nonfarm women at all ages except 65 years and over.

Higher labor force participation is distinctive of the rural farm population; it is not a product of overall urban-rural differences. In fact, the overall rural labor force participation rate of 64 percent was slightly lower than the urban rate of 66 percent in 1988 (table 13). The unemployment rate was modestly lower in rural than urban areas (5.4 percent versus 5.7 percent), but both the rural and urban rates were higher than the farm resident rate.

Occupation. In March 1988, 2.6 percent of the total employed labor force worked solely or primarily in farm occupations (table 14). The proportion has declined steadily since 1820, the first year an industry/occupation question was asked in the census. At that time, more than 70 percent of the Nation's workers had farm occupations. By 1900, the proportion had dropped by almost half, to 37.5 percent.

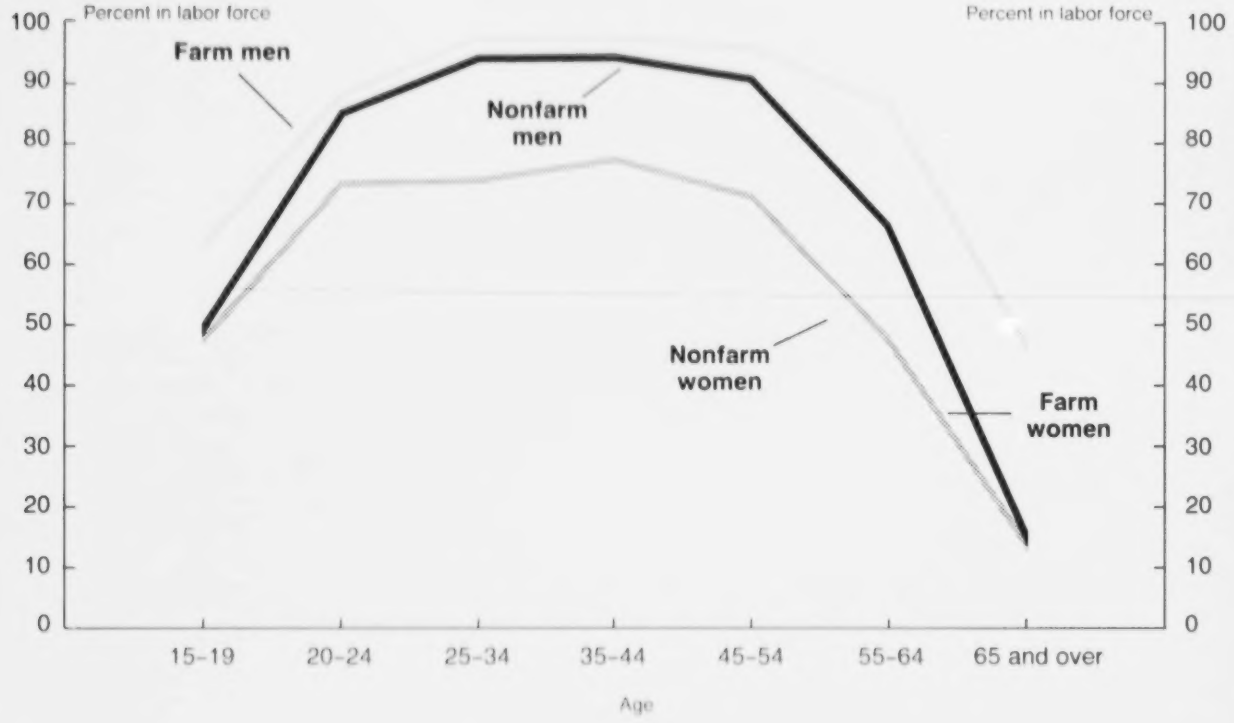
The annual average estimate of the number of persons with farm occupations in 1988 was 3.3 million (table D). This estimate is higher than the March 1988 estimate shown in table 14 because the annual estimate is an average over the 12-month calendar year, and thus includes the peak farm employment months in the summer. About two-fifths of those employed in farm occupations over the year were "farm operators and managers;" the remainder were "farm workers and related occupations." About 9 out of every 10 farm operators and managers lived in rural areas in 1988, and 69 percent of them were on farms (table 15). Only about half of farm workers and workers in related occupations lived in rural areas, and just 17 percent of this group were on farms.[8]

About 55 percent of employed farm residents worked primarily in nonfarm jobs (table D). This pattern differed by sex, however. Farm men most often had farm occupations (59 percent), generally as farm operators and managers. Only one-fourth of farm women worked primarily in farm occupations, with equal proportions in each farm occupation category. The pattern of farm-nonfarm employment also differed between the two major farming regions. In the Midwest, 48 percent of employed farm residents had farm occupations as their primary job, compared with only 37 percent in the South (table 16).

Industry and class of worker. Statistics on industry of employment for rural and farm residents show similar patterns to the occupational data, since most persons

[8]The category "farm workers and related occupations" includes persons in related jobs not performed on farms or in rural settings. According to the 1980 Census of Population, two-thirds of the category were farm workers in 1980; the remaining one-third had related occupations such as groundskeepers and gardeners, and graders, sorters, and inspectors of agricultural products.

Figure 3.
Labor Force Participation of Persons 15 Years and Over, by Age, Sex, and Farm-Nonfarm Residence: 1988



working in farm occupations are classified in the agriculture industry. The majority (70 percent) of agricultural workers lived in rural areas in 1988, but a minority (39 percent) resided on farms (table 17). A little over half (53 percent) of employed farm residents worked primarily in nonagricultural industries, but this proportion varied by sex and region (table 18). Farm men most often had agricultural jobs (59 percent); their leading nonagricultural industry was manufacturing. Farm women most frequently held nonagricultural jobs, mainly in services.

Table D. **Occupation of Employed Persons 15 Years and Over, by Sex and Farm-Nonfarm Residence: 1988**

(Current Population Survey annual averages. Numbers in thousands)

Farm workers and related occupations	369	115	253	0.7	11.1	0.5
Nonfarm occupations	51,384	784	50,601	98.9	75.8	99.4

A higher proportion of farm residents were employed in agriculture in the Midwest (50 percent) than in the South (38 percent).

Farm residents show a different distribution by class of worker than their nonfarm counterparts. Among employed farm residents in 1988, 38 percent were self-employed, 58 percent were wage and salary workers, and 5 percent were unpaid family workers; the nonfarm distribution was 8 percent, 92 percent, and 0.3 percent, respectively (table 19). Self-employment and unpaid family work are more common among agricultural workers than nonagricultural workers, and the highest proportions of self-employed and unpaid family workers are generally found among persons living on farms.

Self-employment in agriculture is more pronounced among farm men than women. In 1988, 71 percent of farm men working in agriculture were self-employed, compared with 50 percent of farm women. A much lower proportion of farm men than women who were working in agriculture were unpaid family workers (4 percent versus 28 percent), and similar proportions (24 percent and 22 percent) of both sexes were in wage and salary jobs.

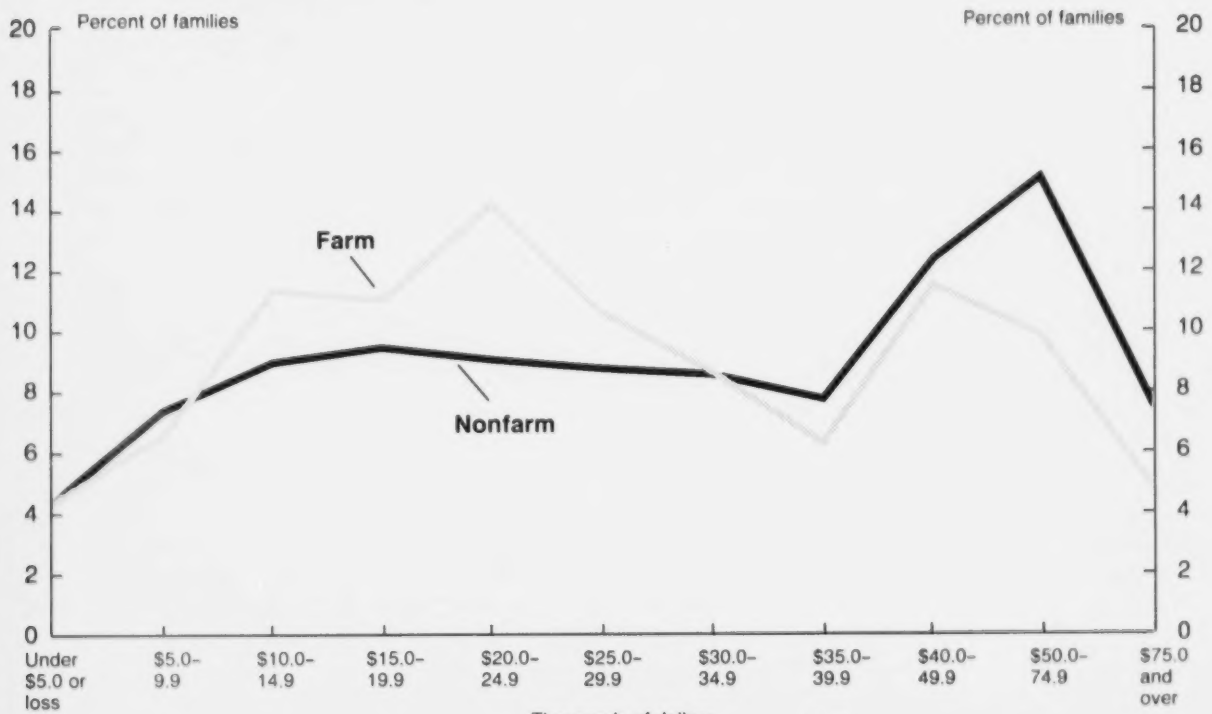
Self-employment is less common among rural nonfarm than rural farm workers (table 20). Even among agricultural workers, only 31 percent of those living in rural nonfarm areas were self-employed, compared with 67 percent of those living on farms.

Income and poverty. Money income for the year 1987 was lower for households and families living on farms than for those in nonfarm areas. The median income was $24,130 for farm households and $26,030 for nonfarm households, according to the March 1988 CPS supplement (table 21). The median income of farm families was $26,020 in 1987, just 84 percent of the nonfarm family median of $30,970. The relative concentration of farm families in the lower income levels is shown in figure 4.

After adjusting for the 3.7 percent increase in consumer prices between 1986 and 1987, neither median household income nor median family income showed statistically significant change for either farm or nonfarm residents.[9]

[9]U.S. Bureau of the Census, Current Population Reports, Series P-60, No. 162, *Money Income of Households, Families, and Persons in the United States: 1987*, U.S. Government Printing Office, Washington, DC, 1989.

Figure 4.
Income Distribution of Families, by Farm-Nonfarm Residence: 1987



The income reported by farm households and families includes both farm and nonfarm sources. The Economic Research Service has estimated the sources of cash income received by households of farm operators.[10] They estimate that in 1987 about 45 percent of cash income of farm operator households came from off-farm sources. Farm operator households with annual farm sales of less than $40,000, which represent 73 percent of all farms, received 81 percent of the total off-farm income.

The March 1988 CPS showed a decline in the farm resident poverty rate from 19.6 to 12.6 percent between 1986 and 1987.[11] The 1987 poverty rate for farm residents is not statistically different from the nonfarm rate of 13.5 percent. This is an unusual situation since the poverty rate has been higher among farm than nonfarm residents throughout the 1980's. The last time the poverty rates were similar was in 1978 and 1979, and the drop in farm poverty rate between 1977 and 1978 that produced the similarity was accompanied by a large increase in real income for farm families.[12] There was no accompanying increase in farm family income between 1986 and 1987.

Data on consumer income collected in the CPS are limited to money income received before payments of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions such as union dues or Medicare premiums. Money income is the sum of amounts received from earnings; Social Security and public assistance payments; dividends, interest, and rent; unemployment and worker's compensations; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that some portion of all families receive part of their income in the form of noncash benefits such as food stamps, health benefits, and subsidized housing; that some farm families receive noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that some nonfarm residents receive noncash benefits such as the use of business transportation and facilities, full or partial payments by business for retirement programs, and medical and educational expenses. These elements should be considered when comparing income levels.

Table E. **Poverty Status of Persons and Families, by Farm-Nonfarm Residence: 1987**

(March 1988 Current Population Survey. Numbers in thousands. Persons and families as of March 1988)

Persons and families	Total	Farm	Nonfarm

RELATED MATERIALS

Comparable figures for 1987 appear in Current Population Reports, Series P-27, No. 61, *Rural and Rural Farm Population: 1987.* A list of publications for earlier years follows appendix B of this report.

Although not fully comparable with the Current Population Survey, data on the farm population collected in the 1980 census are available for all States on computer files (referred to as summary tape files, or STF's) as well as in published reports. Farm population data appear in STF 3 and STF 4 and in four report series and one Subject Report. The two report series based on STF 3 containing farm population data are Series PHC80-S2, *Advanced Estimates of Social, Economic, and Housing Characteristics,* and Series PHC80-4, *Congressional Districts of the 98th Congress.* The two report series presenting farm population data based on STF 4 are Series PC80-1-C, *General Social and Economic Characteristics,* and Series HC80-1-B, *Detailed Housing Characteristics.* The Subject Report, PC80-2-9C, *Characteristics of the Rural and Farm-Related Population,* presents characteristics of the population living on farms, the population receiving farm self-employment income, and the population employed in agriculture.

Appendix A. Definitions and Explanations

Population coverage. The total population figures shown in table B relate to the resident population of the United States. All of the population and household numbers in tables A, 8, and 14 and in figures 1 and 2 and the farm population numbers in tables B and 1 are a combination of counts from decennial censuses and estimates restricted to the civilian noninstitutional population from the Current Population Survey. The estimates in tables C, D, 2 to 5, 7, 10 to 13, and 15 to 20 and in figure 3 relate solely to the civilian noninstitutional population. The estimates shown in tables E, 6, 9, and 21 and in figure 4 relate to the civilian noninstitutional population plus members of the Armed Forces in the United States living off post or with their families on post.

Farm population. In the Current Population Survey, the farm population as currently defined consists of all persons living in rural territory on places from which $1,000 or more of agricultural products were sold during the preceding 12 months. Persons living in summer camps, motels, and tourist camps are classified as nonfarm. The current definition was introduced into the P-27 series beginning with the 1978 farm population report.

Under the previous farm definition, the farm population consists of all persons living in rural territory on places of 10 or more acres if at least $50 worth of agricultural products were sold from the place during the preceding 12 months. Persons living on places of under 10 acres were also included if agricultural sales totaled $250 or more.

Persons living on farms located within the boundaries of urban territory are not included in the farm population. Estimates of the farm population in the 1963 through 1971 Current Population Surveys were limited to rural territory as determined in the 1960 Census of Population. For 1972 through 1983, the urban-rural boundaries used were those of the 1970 Census of Population. The 1984 and 1985 annual averages of rural farm population are based on a mixture of urban and rural geography from the 1970 and 1980 population censuses. During the period April 1984 through June 1985, the Bureau of the Census systematically introduced a new sample design for the Current Population Survey reflecting the results of the 1980 census. For the phase-in period, the urban and rural estimates were derived from a mix of the two sample designs. The 1986 to 1988 annual averages are based on the urban and rural geography from the 1980 population census.

Nonfarm population. The nonfarm population includes rural persons not living on farms plus the urban population.

Annual averages. Annual estimates are computed by averaging monthly data for the calendar year for which the estimates are prepared. Each of the 12 months is given equal weight.

Five-quarter averages centered on April. April-centered annual averages of the farm population are computed by using data for the five quarters centered on the April date for which the estimates are prepared. For example, for April 1983, quarterly estimates for the months of October 1982, and January, April, July, and October 1983 were used with a weight of one-eighth given to each of the two October estimates and a weight of onefourth to each of the estimates for the other three months.

Urban-rural residence. The 1988 CPS annual averages are based on the urban and rural geography delineated for the 1980 census. No changes have been made in the classification of urban and rural territory since the 1980 census.

According to the 1980 census definition, the urban population comprises all persons living in (a) places of 2,500 or more inhabitants incorporated as cities, villages, boroughs (except in Alaska and New York), and towns (except in the New England States, New York, and Wisconsin), but excluding those persons living in the rural portions of extended cities (places with low population density in one or more large parts of their area); (b) census designated places (previously termed unincorporated) of 2,500 or more inhabitants; and (c) other territory, incorporated or unincorporated, included in urbanized areas. An urbanized area consists of a central city or a central core, together with contiguous closely settled territory, that combined have a total population of at least 50,000.

The population not classified as urban constitutes the rural population. The farm population is identified only in rural territory, and the rural farm population constitutes only a part of the total rural population.

The major difference between the current urban definition, in effect since 1950, and earlier definitions is the addition of the urbanized area concept. This change improved measurement of urban territory to include

many large and densely settled areas previously excluded merely because they were not considered "incorporated places." For detailed discussions of the urban definitions used up to 1940 and of the major changes implemented in 1950, see U.S. Bureau of the Census, Current Population Reports, Series P-23, No. 1, *The Development of the Urban-Rural Classification in the United States: 1874 to 1949,* and *U.S. Census of Population: 1950,* Vol. 1, pp. XV-XVIII.

Geographic regions. The four major regions of the United States for which data are presented consist of the following States:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSAs are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 30, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan areas as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

The new CPS metropolitan estimates have consistently been higher than independent estimates of the metropolitan population prepared by the Census Bureau; the new CPS nonmetropolitan estimates have been lower than the independent estimates. For example, between July 1985 and August 1986, the magnitude of the monthly differences varied from 900,000 to 2.5 million persons, so that the proportion of the population living in metropolitan areas according to the CPS has ranged from 0.4 to 1.0 percentage points higher than the independent estimate. The difference in level between the two sets of estimates is partially attributable to the basic CPS sample design, which, because of sampling variability, includes an oversample of metropolitan households and an undersample of nonmetropolitan households. The monthly variations result from the exit and entrance of rotation groups, each with slightly different metropolitan-nonmetropolitan proportions, into the sample. The apparent overestimation of metropolitan and underestimation of nonmetropolitan population in the CPS relative to the Bureau's independent estimates should be taken into account when using the data.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Hispanic origin. Persons of Hispanic origin are those who indicate that their origin is Mexican, Puerto Rican, Cuban, Central or South American, or some other Hispanic origin. Persons of Hispanic origin may be of any race.

Age. The age classification is based on the age of the person at last birthday.

Median age. The median age is the age which divides the population into two equal-size groups, one younger and the other older than the median.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married,

spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded. The number of householders is equal to the number of households. The number of family householders is equal to the number of families.

Family. A family is a group of two or more persons (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members such as children and their spouses) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above); it includes any unrelated persons (unrelated subfamily members and/or secondary individuals) who reside there. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives.

Own children. Own children in a family are sons and daughters, including stepchildren and adopted children of the householder. The count of own children under 18 years old is limited to single (never-married) children.

Children ever born. The term "children ever born" refers to the total number of live births reported by women. Included in the number are children born to the woman before her present marriage, children no longer living, and children away from home, as well as children who are still living in the home.

Labor force and employment status. The labor force and employment estimates relate to the population 15 years old and over.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. Data are shown only for the civilian labor force.

Employed. Employed persons include all civilians who, during the specified week (1) did any work as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm, or in a business operated by a member of the family, or (2) were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labormanagement dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Not in the labor force. All civilians 15 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work for less than 15 hours during the survey week are also classified as not in the labor force.

Occupation. Data on occupation refer to the job held during the survey week. Persons with more than one job during the survey week were classified as employed in the occupation in which they worked the greatest number of hours during the week. The occupational groups are based on the classification system used in the 1980 Census of Population.

Farm occupations. The occupation categories "farm operators and managers" and "farm workers and related occupations" are considered farm occupations. "Farm workers and related occupations" includes farm, marine life, cultivation, and nursery workers; groundskeepers and gardeners; animal caretakers; and graders, sorters, and inspectors of agricultural products.

Nonfarm occupations. The category includes all occupations not classified as farm.

Industry. Data on industry refer to the job held during the survey week. Persons with more than one job during the survey week were classified as employed in the industry in which they worked the greatest number of hours during the week. The industry groups are based on the classification system used in the 1980 Census of Population.

Agriculture. The industry category "agriculture" includes (1) farm operators, managers, and laborers; (2) persons employed on farms in occupations such as truck driver, mechanic, and bookkeeper; and (3) persons engaged in certain activities other than strictly farm operation such as cotton ginning, contract farm services, veterinary and breeding services, hatcheries, experimental stations, greenhouses, landscape gardening, tree service, trapping, hunting preserves, and kennels.

Nonagricultural industries. The category includes all industries not specifically classed under agriculture.

Class of worker. Persons are classified into three categories based on type of employment during the survey week.

Self-employed workers. Persons who worked for profit or fees in their own business, profession, or trade, or who operated a farm either as an owner or tenant.

Wage and salary workers. Persons who worked for any governmental unit or private employer for wages, salaries, commissions, tips, pay "in kind," or at piece rates.

Unpaid family workers. Persons who worked 15 or more hours per week without pay on a farm or in a business operated by a person to whom they are related by birth or marriage.

Money income. This is defined as the algebraic sum of money wages and salaries, net income from farm and nonfarm selfemployment, and income other than earnings. Data on income cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of noncash benefits such as food stamps, health benefits, and subsidized housing; that some farm families receive noncash benefits in the form of rentfree housing and goods produced and consumed on the farm; or that noncash benefits are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels.

For each person in the CPS 15 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security Income; (6) public assistance or welfare payments; (7) interest on savings or other investments which pay interest; (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and workers' compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

Receipts from the following sources are not included as income: (1) money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

Family income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

In the income distribution for families, the lowest income group (under $5,000 or loss) includes those families who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm selfemployment or in rental income. Some of these were living on income "in kind," savings, or gifts; or were newly constituted families; or families in which the sole earner had recently died or had left the household. However, other families who reported no income probably had some money income which was not recorded in the survey.

It should be noted that although the income statistics refer to receipts during the preceding year, the composition of families refers to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. However, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Median and mean income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group. The medians and means for households and families are based on all households and families.

Poverty definition. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index originated at the Social Security Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1981. The poverty index is based solely on money income and does not reflect the fact that many low-income persons receive noncash benefits such as food stamps, Medicaid, and public housing. The index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of families based on their size and composition. It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the Economy Food Plan. For smaller families and persons living alone, the cost of the Economy Food Plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI). The average poverty threshold for a family of four was $11,611 in 1987, about 3.6 percent higher than the comparable 1986 cutoff of $11,203. For further details, see Current Population Reports, Series P-60, No. 163.

Rounding. The individual figures in this report are rounded to the nearest thousand. With few exceptions, the individual figures have not been adjusted to group totals, which are independently rounded. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals however, are always shown as 100.0. Percentages are based on the rounded absolute numbers. 9

Appendix B. Source and Accuracy of Estimates

SOURCE OF DATA

Most estimates in this report come from data obtained from the Current Population Survey (CPS) for the year 1988. The Bureau of the Census conducts this survey every month; this report uses annual averages of the monthly data for its estimates. Some estimates come from 1980 decennial census data and reports from the U.S. Department of Agriculture.

Current Population Survey. The CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 14 years old and over in every sample household. For this report, persons in the Armed Forces living off post or with their families on post are also included.

The present CPS sample was selected from the 1980 decennial census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 56,100 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,500 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

Estimation procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces. The independent population estimates used from 1981 to the present were based on updates to controls established by the 1980 decennial census. Data previous to 1981 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133).

Description of the Current Population Survey

Time period	Number of sample areas	Housing units eligible	
		Interviewed	Not interviewed
1988	729	53,600	2,500
1986 to 1987	729	57,000	2,500
1985	[1] 629/729	57,000	2,500
1982 to 1984	629	59,000	2,500
1980 to 1981	629	65,500	3,000
1977 to 1979	614	55,000	3,000
1973 to 1976	461	46,500	2,500
1972	449	45,000	2,000
1967 to 1971	449	48,000	2,000
1963 to 1966	357	33,500	1,500
1960 to 1962	333	33,500	1,500

[1]The CPS was redesigned following the 1980 Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

The estimates in this report for 1985 and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

ACCURACY OF ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of error, but the full

extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling variability. Nonsampling errors can be attributed to many sources. These sources include the inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or unwillingness to provide correct information or to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 decennial census, overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey,* Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology,* Bureau of the Census, U.S. Department of Commerce.

Sampling variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described later in "Standard errors and their use," are primarily measures of sampling variability, although they may include some nonsampling error.

Comparability of data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates in this report, which reflect 1980 census-based population controls, with estimates for 1980 and earlier years, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percentage distributions, but did have a significant impact on levels. For example, use of 1980-based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1985, compare Hispanic estimates over time cautiously.

Note when using small estimates. Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard errors and their use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. Thus, the tables show levels of magnitude of standard errors rather than the precise standard errors.

The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same

general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (±1.0)," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the median age of farm residents to the median age of nonfarm residents.

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.6 times the standard error of the difference.

Standard errors of estimated numbers. There are two ways to compute the approximate standard error, s_x, of an estimated number shown in this report. The first uses the formula

$$s_x = fs \qquad (1)$$

where f is a factor from table B-5 or B-6, and s is the standard error of the estimate obtained by interpolation from table B-1 or B-2. The second method uses formula (2), from which the standard errors in tables B-1 and B-2 were calculated. This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in tables B-5 and B-6 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Table B-1. **Standard Errors of Estimated Numbers: Labor Force Characteristics**

(In thousands)

Size of estimate	Standard error
25	8
50	11
100	15
250	24
500	34
1,000	48
2,500	75
5,000	105
10,000	146
15,000	175
25,000	217
50,000	272
100,000	260
120,000	207
140,000	73

Note: For a particular characteristic, see table B-5 or B-6 for the appropriate factor to apply to the above standard errors.

Illustration. Table B of this report shows an annual average estimate of 4,951,000 White farm residents in 1988. Using formula (1) with f = 0.9 from table B-5 and s = 143,000 by interpolation from table B-2 gives the approximate standard error:

$$s_x = (0.9)(143{,}000) = 129{,}000$$

Alternatively, using formula (2) with a = -0.000024 and b = 3,417, the approximate standard error is

$$s_x = \sqrt{(-0.000024)(4{,}951{,}000)^2 + (3{,}417)(4{,}951{,}000)} = 128{,}000$$

The 90-percent confidence interval for the average number of White farm residents in 1988 is from 4,746,000 to 5,156,000, i.e., 4,951,000 ± 1.6(128,000). Therefore, a conclusion that the average estimate derived from all

180,000	424
200,000	358

Note: For a particular characteristic, see table B-5 or B-6 for the appropriate factor to apply to the above standard errors.

Table B-3. **Standard Errors of Estimated Percentages: Labor Force Characteristics**

Base	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
25	3.0	4.2	6.6	9.1	13.1	15.1
50	2.1	3.0	4.7	6.4	9.2	10.7
100	1.5	2.1	3.3	4.5	6.5	7.5
250	0.9	1.3	2.1	2.9	4.1	4.8
500	0.7	0.9	1.5	2.0	2.9	3.4
1,000	0.5	0.7	1.0	1.4	2.1	2.4
2,500	0.3	0.4	0.7	0.9	1.3	1.5
5,000	0.2	0.3	0.5	0.6	0.9	1.1
10,000	0.2	0.2	0.3	0.5	0.7	0.8
15,000	0.1	0.2	0.3	0.4	0.5	0.6
25,000	0.1	0.1	0.2	0.3	0.4	0.5
50,000	0.1	0.1	0.1	0.2	0.3	0.3
100,000	0.05	0.1	0.1	0.1	0.2	0.2
120,000	0.04	0.1	0.1	0.1	0.2	0.2
140,000	0.04	0.1	0.1	0.1	0.2	0.2

Note: For a particular characteristic, see table B-5 or B-6 for the appropriate factor to apply to the above standard errors.

possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table B-5 or B-6 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula:

$$s_{x,p} = fs \qquad (3)$$

In this formula, f is the appropriate factor from table B-5 or B-6, and s is the standard error of the estimate obtained by interpolation from table B-3 or B-4.

Alternatively, formula (4) will provide more accurate results:

$$s_{x,p} = \sqrt{bp(100 - p)/x} \qquad (4)$$

Here x is the total number of persons, families, households, or unrelated individuals in the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table B-5 or B-6 associated with the characteristic in the numerator of the percentage.

Table B-4. **Standard Errors of Estimated Percentages: Characteristics Other Than Labor Force**

Base	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
25	4.1	5.8	9.0	12.4	17.8	20.6
50	2.9	4.1	6.3	8.7	12.6	14.6
100	2.0	2.9	4.5	6.2	8.9	10.3
250	1.3	1.8	2.8	3.9	5.6	6.5

200,000	0.05	0.1	0.1	0.1	0.2	0.2

Note: For a particular characteristic, see table B-5 or B-6 for the appropriate factor to apply to the above standard errors.

Illustration. Table D shows that 45.5 percent of the 2,701,000 employed farm residents age 15 years and over had farm occupations in 1988. Using formula (3) with f = 1.2 from table B-5 and s = 1.5 by interpolation from table B-3, the approximate standard error is

$$s_{x,p} = (1.2)(1.5) = 1.8$$

Using formula (4) the standard error of the percentage of farm residents with farm occupations is

$$s_{x,p} = \sqrt{\frac{3,417}{2,701,000}(45.5)(54.5)} = 1.8$$

Consequently, the 90-percent confidence interval for the percentage of employed farm residents age 15 years and over with farm occupations in 1988 is from 42.6 to 48.4 percent, i.e., 45.5 ± 1.6(1.8).

Standard error of a difference. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2} \qquad (5)$$

where s_x and s_y are the standard errors of the estimates, x and y. The estimates can be numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration. Table E shows that 12.6 percent of the 4,876,000 farm residents were below the poverty level in 1988, and 13.5 percent of the 236,014,000 nonfarm residents were below the poverty level in 1988. The apparent difference between these percentages is 0.9 percent. Using b = 21,828 from table B-6 and formula (4), the standard error on the estimate of 12.6 percent with a base of 4,876,000 is

$$s_{x,p} = \sqrt{\frac{21,828}{4,876,000}(12.6)(87.4)} = 2.2$$

Similarly, the standard error on the estimate of 13.5 percent with b = 11,428 from table B-6 is

$$s_{y,p} = \sqrt{\frac{11,428}{236,014,000}(13.5)(86.5)} = 0.2$$

Using formula (5) the approximate standard error of the estimated difference of 0.9 percent is

$$s_{x-y} \sqrt{(2.2)^2 + (0.2)^2} = 2.2$$

This means that the 90-percent confidence interval on the difference between farm and nonfarm residents below the poverty level in 1988 is from -2.6 to 4.4, i.e., 0.9 ± 1.6(2.2). Since this interval contains zero, we are unable to conclude that the percentages of farm and nonfarm residents below the poverty level in 1988 are significantly different.

Standard error of a median. The sampling variability of an estimated median depends on the form of the distribution and the size of the base. One can approximate the reliability of an estimated median by determining a confidence interval about it. (See the section on standard errors and their use for a general discussion of confidence intervals.)

Estimate the 68-percent confidence limits of a median based on sample data using the following procedure.

1. Determine, using formula (4), the standard error of the estimate of 50 percent from the distribution.

65 years and older	-0.000144	3940	1.0
Families:			
Total	+0.000100	2454	0.8

NOTE: For standard error parameters of regional data apply the following factors to the above parameters: Northeast—0.83, Midwest—0.93, South—0.98, West—1.37, Northeast, Midwest, and West—1.03. For nonmetropolitan or rural characteristics, apply the factor 1.5 to the parameters listed in tables B-5 and B-6.

2. Add to and subtract from 50 percent the standard error determined in step 1.

3. Using the distribution of the characteristic, determine upper and lower limits of the 68-percent confidence interval by calculating values corresponding to the two points established in step 2.

   Use the following formula to calculate the upper and lower limits.

$$s_{pN} = \frac{pN - N_1}{N_2 - N_1}(A_2 - A_1) + A_1 \qquad (7)$$

   where

   X_{pN} = estimated upper and lower bounds for the confidence interval ($0 \leq p \leq 1$). For purposes of calculating the confidence interval, p takes on the values determined in step 2. Note that X_{pN} estimates the median when $p = 0.50$.

   N = for distribution of numbers: the total number of units (persons, households, etc.) for the characteristic in the distribution.

   N = for distribution of percentages: the value 1.0.

   p = the values obtained in step 2.

   A_1, A_2 = the lower and upper bounds, respectively, of the interval containing X_{pN}.

   N_1, N_2 = for distribution of numbers: the estimated number of units (persons, households, etc.) with values of the characteristic greater than or equal to A_1 and A_2, respectively.

   N_1N_2 = for distribution of percentages: the estimated percentage of units (persons, households, etc.) having values of the characteristic greater than or equal to A_1 and A_2, respectively.

4. Divide the difference between the two points determined in step 3 by two to obtain the standard error of the median.

Illustration. Table 4 of this report shows that the estimated median age of farm residents in 1988 was 38.0 years. The base of the distribution from which this median was determined, N, was 4,951,000 persons.

1. Using formula (4), and b = 3,417 from table B-5, the standard error of 50 percent with a base of 4,951,000 is

$$\sqrt{\frac{3{,}417}{4{,}951{,}000}(50.0)(50.0)} = 1.3$$

2. To obtain the 68-percent confidence interval, add to and subtract from 50 percent the standard error found in step 1. This yields percentage limits of 48.7 and 51.3.

3. Table 4 also shows that 2,667,000 farm residents were 35 years of age or older and 2,346,000 were 40 years or older. Use formula (7) to find the upper limit on the 68-percent confidence interval:

$$\frac{0.487(4{,}951{,}000) - 2{,}667{,}000}{2{,}346{,}000\text{-}2{,}667{,}000}(40\text{-}35) + 35 = 39.0$$

   Similarly, since the lower limit is in the same age range, it can be computed as

$$\frac{0.513(4{,}951{,}000) - 2{,}667{,}000}{2{,}346{,}000\text{-}2{,}667{,}000}(40\text{-}35) + 35 = 37.0$$

4. The standard error of the median age of farm residents can be approximated as

$$s_{median} = \frac{39.0 - 37.0}{2} = 1 \text{ year}$$

   The 90-percent confidence interval on the median age of farm residents is found to be from 36.4 to 39.6, i.e., $38 \pm 1.6(1.0)$.

35 ○ *(Skip to item 23)*
1–34 ○ *(Go to 20C)*
36–48 ○ *(Go to 20D)*

20C. Does . . . USUALLY work 35 hours or more a week at this job?

Yes ○ **What is the reason . . . worked less than 35 hours LAST WEEK?**

No ○ **What is the reason . . . USUALLY works less than 35 hours a week?**

(Mark the appropriate reason)

Slack work ○
Material shortage ○
Plant or machine repair ○
New job started during week ○
Job terminated during week ○
Could find only part-time work ○
Holiday *(Legal or religious)* ○
Labor dispute ○
Bad weather ○
Own illness ○
On vacation ○
Too busy with housework, school, personal bus., etc. ○
Did not want full time work ○
Full-time work week under 35 hours ○
Other reason *(Specify)* ○

(Skip to 23 and enter job worked at last week)

20D. Did . . . lose any time or take any time off LAST WEEK for any reason such as illness, holiday or slack work?

Yes ○ How many hours did . . . take off?

(Correct 20A if lost time not already deducted, if 20A reduced below 35, correct 20B and fill 20C)

No ○

20E. Did . . . work any overtime or at more than one job LAST WEEK?

Yes ○ How many extra hours did . . . work?

(Correct 20A and 20B as necessary if extra hours not already included and skip to 23.)

No ○ *(Skip to 23)*

21. *(If J in 19, skip to 21A.)* Did . . . have a job or business from which he/she was temporarily absent or on layoff LAST WEEK?

Yes ○ No ○ *(Go to 22)*

21A. Why was . . . absent from work LAST WEEK?

Own illness . . . . . ○
On vacation . . . . . ○
Bad weather . . . . . ○
Labor dispute . . . . . ○
New job to begin within 30 days ○ *(Skip to 22B and 22C3)*
Temporary layoff *(Under 30 days)* ○
Indefinite layoff *(30 days or more or no def. recall date)* ○ *(Skip to 22C3)*
Other *(Specify)* . . ○

21B. Is . . . receiving wages or salary from his/her employer for any of the time off LAST WEEK?

Yes ○
No ○

21C. Does . . . usually work 35 hours or more a week at this job?

Yes ○
No ○

(Skip to 23 and enter job held last week)

22. *(If LK in 19, Skip to 22A.)* Has . . . been looking for work during the past 4 weeks?

Yes ○ No ○ *(Go to 24)*

22A. What has . . . been doing in the last 4 weeks to find work? *(Mark all methods used, do not read list.)*

Checked with— pub. employ. agency ○; pvt. employ. agency ○; employer directly ○; friends or relatives ○
Placed or answered ads . . . . ○
Nothing *(Skip to 24)* . . . . . ○
Other *(Specify in notes, e.g., ITPA, union or prof. register, etc.)* . . . . . ○

22B. At the time . . . started looking for work, was it because he/she lost or quit a job or was there some other reason?

- Lost job . . . . . ○
- Quit job . . . . . ○
- Left school . . . . . ○
- Wanted temporary work ○
- Change in home or family responsibilities ○
- Left military service ○
- Other *(Specify in notes)* . . ○

22C. 1) How many weeks has . . . been looking for work?

2) How many weeks ago did . . . start looking for work?

3) How many weeks ago was . . . laid off?

22D. Has . . . been looking for full-time or part-time work?

Full ○ Part ○

22E. Could . . . have taken a job LAST WEEK if one had been offered?

Yes ○ No ○ Why not?

Already has a job . . . ○
Temporary illness . . . ○
Going to school . . . . . ○
Other *(Specify in notes)* ○

22F. When did . . . last work at a full-time job or business lasting 2 consecutive weeks or more?

Within last 12 months *(Specify)* . . ○
(Month) _____
One to five years ago . . . . . ○
More than 5 years ago . . . . . ○
Never worked full-time 2 wks. or more . . . . . ○
Never worked at all . . . . . ○

(SKIP to 23. If layoff entered in 21A, enter job, either full or part time, from which laid off. Else enter last full time job lasting 2 weeks or more, or "never worked.")

24. INTERVIEWER CHECK ITEM *(Rotation number)*
First digit of SEGMENT number is:

○ 2, 3, 4, 6, 7 or 8 *(Skip to 26)*
○ 1 or 5 *(Go to 24A)*

24A. When did . . . last work for pay at a regular job or business, either full- or part time?

Within past 12 months ○
1 up to 2 years ago ○
2 up to 3 years ago ○ *(Go to 24B)*
3 up to 4 years ago ○
4 up to 5 years ago ○
5 or more years ago ○
Never worked . . . . . ○ *(Skip to 24C)*

24B. Why did . . . leave that job?

Personal, family *(Incl. pregnancy)* or school . . . ○
Health . . . . . ○
Retirement or old age . . . . . ○
Seasonal job completed . . . . . ○
Slack work or business conditions ○
Temporary nonseasonal job completed . . ○
Unsatisfactory work arrangements *(Hours, pay, etc.)* ○
Other . . . . . ○

24C. Does . . . want a regular job now, either full- or part time?

Yes ○ *(Go to 24D)*
Maybe — it depends ○ *(Specify in notes)*
No ○ *(Skip to 24E)*
Don't know ○

24D. What are the reasons . . . is not looking for work? *(Mark each reason mentioned)*

- Believes no work available in line of work or area ○
- Couldn't find any work . . . ○
- Lacks nec. schooling, training, skills or experience ○
- Employers think too young or too old . . . ○
- Other pers. handicap in finding job ○
- Can't arrange child care ○
- Family responsibilities . . . . ○
- In school or other training . . . ○
- Ill health, physical disability . . . ○
- Other *(Specify in notes)* . . . ○
- Don't know . . . . . ○

24E. Does . . . intend to look for work of any kind in the next 12 months?

Yes ○
It depends *(Specify in notes)* ○
No ○
Don't know ○

(If entry in 24B, describe job in 23, otherwise, skip to 26)

25. INTERVIEWER CHECK ITEM *(Rotation number)*
First digit of SEGMENT number is:

○ 2, 3, 4, 6, 7 or 8 *(Skip to 26)*
○ 1 or 5 *(Go to 25A)*

25A. How many hours per week does . . . USUALLY work at this job?

25B. Is . . . paid by the hour on this job?

Yes ○ *(Go to 25C)*
No ○ *(Skip to 25D)*

25C. How much does . . . earn per hour? Dollars . Cents

$ ¢

(Ask 25D) REF ○

25D. How much does . . . USUALLY earn per week at this job BEFORE deductions? Include any overtime pay, commissions, or tips usually received.

$ REF ○

25E. On this job, is . . . a member of a labor union or of an employee association similar to a union?

Yes ○ *(Skip to 26)*
No ○ *(Ask 25F)*

25F. On this job, is . . . covered by a union or employee association contract?

Yes ○
No ○ *(Go to 26)*
